filmsBuprenorphine-N-acetylcysteine combinations in the treatment of OUD. The buprenorphine-naloxone combination has
become a well-established treatment for opioid use disorder (OUD), with similar efficacy to methadone in achieving abstinence
from opioids. While there are opioid agonist medications available in various formulations, buprenorphine remains the only
medication that has demonstrated efficacy for the treatment of OUD with the advantage of being safe and well-tolerated by a
large percentage of patients. Unfortunately, patients requiring high doses of buprenorphine can experience suboptimal efficacy
due to opioid receptor down-regulation, and an opioid receptor antagonist may be beneficial. Naloxone's antagonist properties
are particularly useful for facilitating rapid opioid withdrawal and increasing overall buprenorphine-induced drug effects.
Naloxone can be combined with buprenorphine to extend the duration of buprenorphine-induced effects for use in a modified
sublingual buprenorphine-naloxone combination (SBC). The SBC can be formulated into a variety of delivery devices for the
buprenorphine dose, such as a sublingual tablet, an oral film or a sublingual tablet combined with an oral film (SubOx). Studies
in humans have demonstrated that the sublingual buprenorphine-naloxone combination is a useful treatment option for OUD
that can provide the benefits of opioid agonist treatment without the side effects associated with methadone. There is evidence
that nalox 82157476af
